Hart, Noah - u1537288 - Actively Contributing

This Sprint was my final Design-focused Sprint. The goal was to give our environment artists layouts and whiteboxes so they can work through the next month, asking only specific questions, since the general design is done and they can update the layout as they see fit with the assets we have. I have also updated the level design document so that we have to go into detail on all puzzles, encounters (as well as what encounters can be in which layouts), and level layouts.

During many meetings, we also discussed reducing things based on scope, as well as putting together a framework for the complete game, from first launch to death, which we want to get in before GDC so that the final month is just polishing and refining the main gameplay, like adding more completed layouts, beefing the core systems, and encounters/modifiers.

Looking ahead, I will be mostly engineering-focused, providing more layouts and level design-related tasks as our environment artists progress, with the main task being getting the main loop completed based on our framework (like adding a connecting car that serves as the exit to the train station and the place between encounters where players select buffs. and helping Anson with enemy-related issues. Other tasks will include balancing or fixing level design issues, like puzzle guidance, setting up a tutorial, making it so a player can go from the train station back to the traincars (train station manager script), and the overarching goal of building up the whole encounter system (the main gameplay loop).

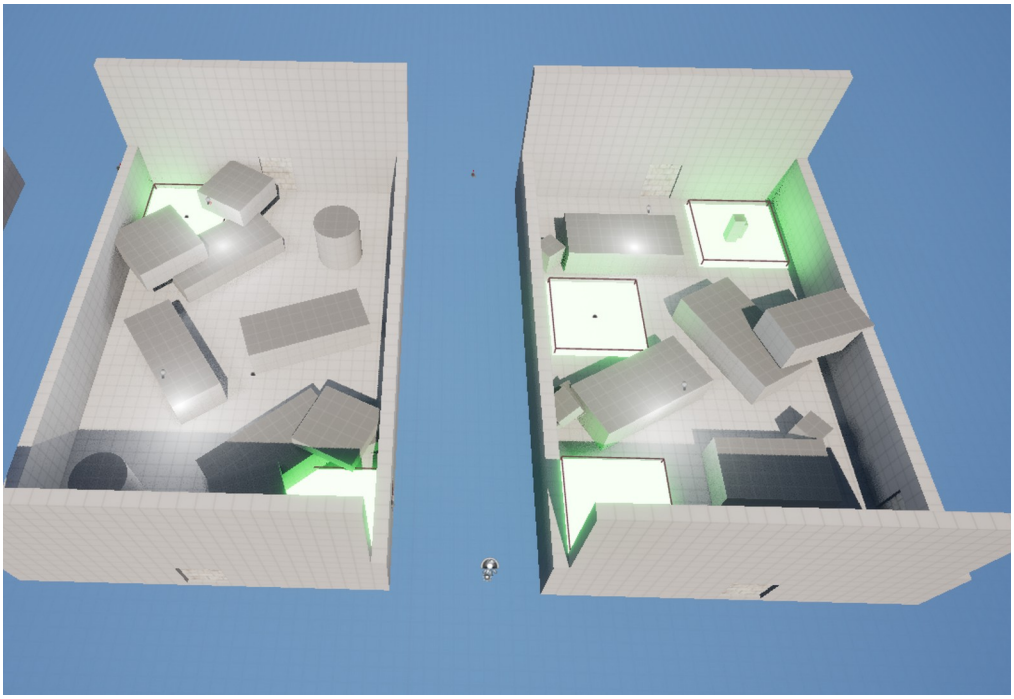

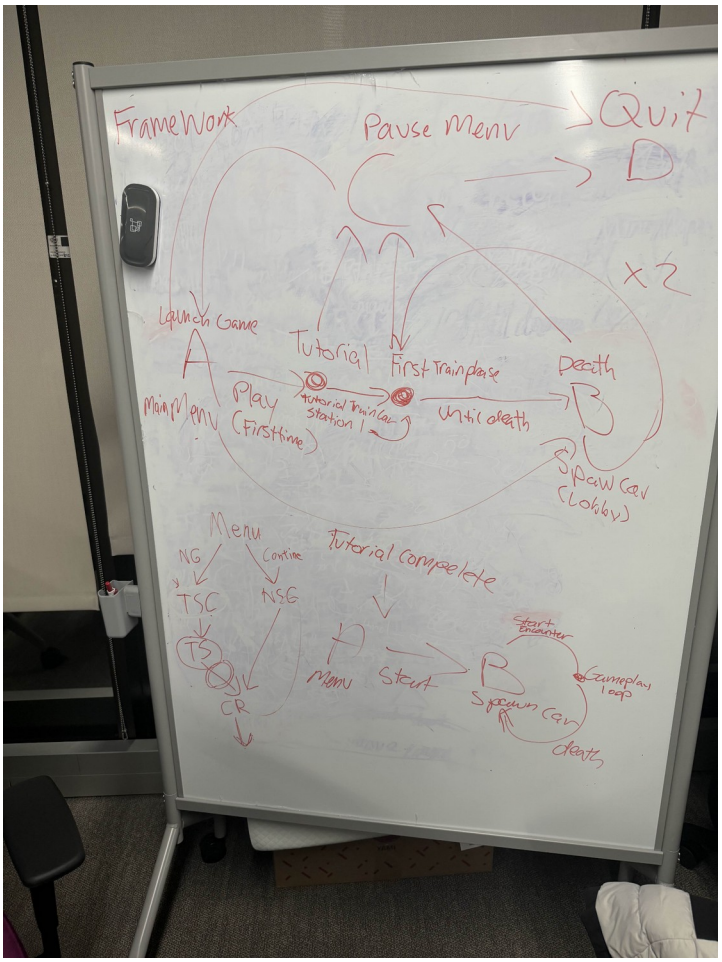

- Drone will have health, if destroyed, run over.

Encounter and Template Matrix

Possible encounters for each Car template, all layouts will (should) be built to accommodate each valid Encounter for that template

	Standard	Standard Double	Long	Long Double (?)
Capture Zone	✅	✅	✅	✅
Survive/Wave	✅	✅	✅	✅
Find and Kill			✅	✅
Escort/Defend		✅	✅	✅
Elite Enemy	✅		✅
