Hart, Noah - u1537288 - Actively Contributing

In this sprint, I created a base enemy class that attacks and chases the player. I implemented an enemy spawner system that is able to keep track of enemies killed per level and randomize certain values to make each level vary. We also had a group member change, which relegated some level design tasks to me by choice. For our prototype, I designed 3 base levels (train cars) that are meant to be altered by layout and hazard design, but are easy for the art team to create, and not overload them with work. I also designed a base train station where the player will loot, solve puzzles, and craft in between waves. I then added level loading in one persistent level to make seamless transitions from one encounter to the next. One task I was not able to implement was basic encounters for the non-tutorial train cars to demonstrate the gameplay loop, although we are going back to the drawing board on how we want to approach this to engage and challenge the player. Also, after integrating all the engineers' mechanics, the level design needs a second pass, as the levels felt too cramped. One bug that I would also like to mention (because I spent a couple of hours trying to fix it, and it made me lose my work because it crashed the engine) is that it caused the Unreal editor to get stuck loading. After isolating it, we were able to fix the issue

on presentation day.

Spawned
Sensitivity: 0.80
size: 60.00
Multiple directional lights are competing to be the single one used for forward shading, translucent, water or volumetric fog. Please adjust their ForwardShadingPriority.
As a fallback, the main directional light will be selected based on overall brightness.
