Hart, Noah - u1537288 - Actively Contributing

In this Sprint, engineering-wise, I was able to put in the full gameplay loop: Wake Up in Spawn -> choose gun/loadout -> Go To first Train Phase (Encounters) -> After completing all Spawned Encounters, open door to Train Station

I Also added a new encounte type, the Capture Zone, Player stand on the Zone while defending waves on enemies until it it full captured, when incorporating the design goals, we want to figure out how long it takes while factoring in decay when not on point, size of point, difficulty of survival, and many other factors, the time taken per encounter should be on average 2-3 minutes, however we need to discuss how long we want the main gameplay loop to take (This also includes Train Station exploration) With our current plan it will take 15-20 minutes to go through a Train phase and a station phase combined, with it taking a total of 50 minutes to beat the game in one run (however the player will start off weak and it will take several runs to be able to beat the boss at the end). This is not final and will be

tuned through the course of the next few sprints.

In the My Level Design portion of this sprint, I whiteboxed out the rooms for the tutorial and first train station, where we will have a room dedicated to a puzzle, and the rest will be looting. Starting next semester, I will dedicate more time to designing the room layouts to be more maze-like to encourage more exploration and not have it be too linear and fast to loot.
