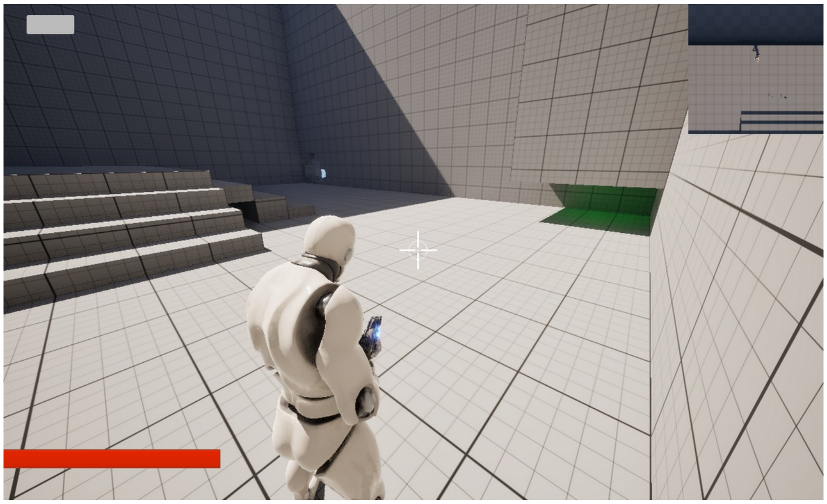
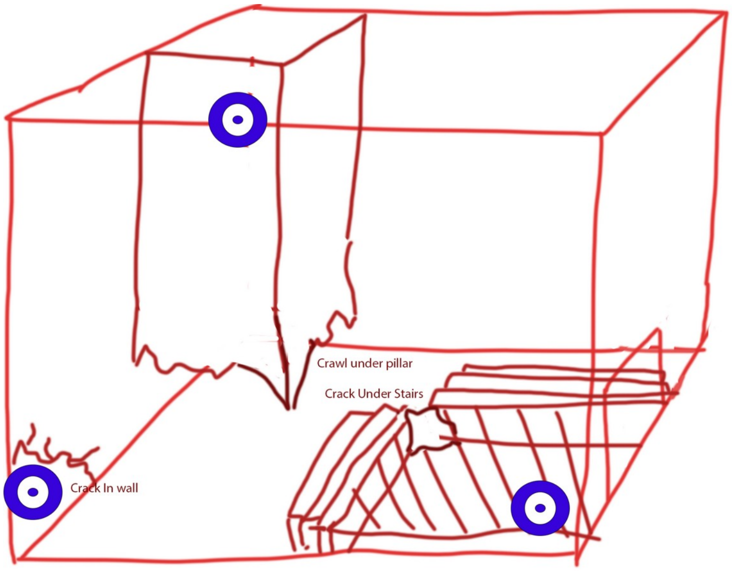
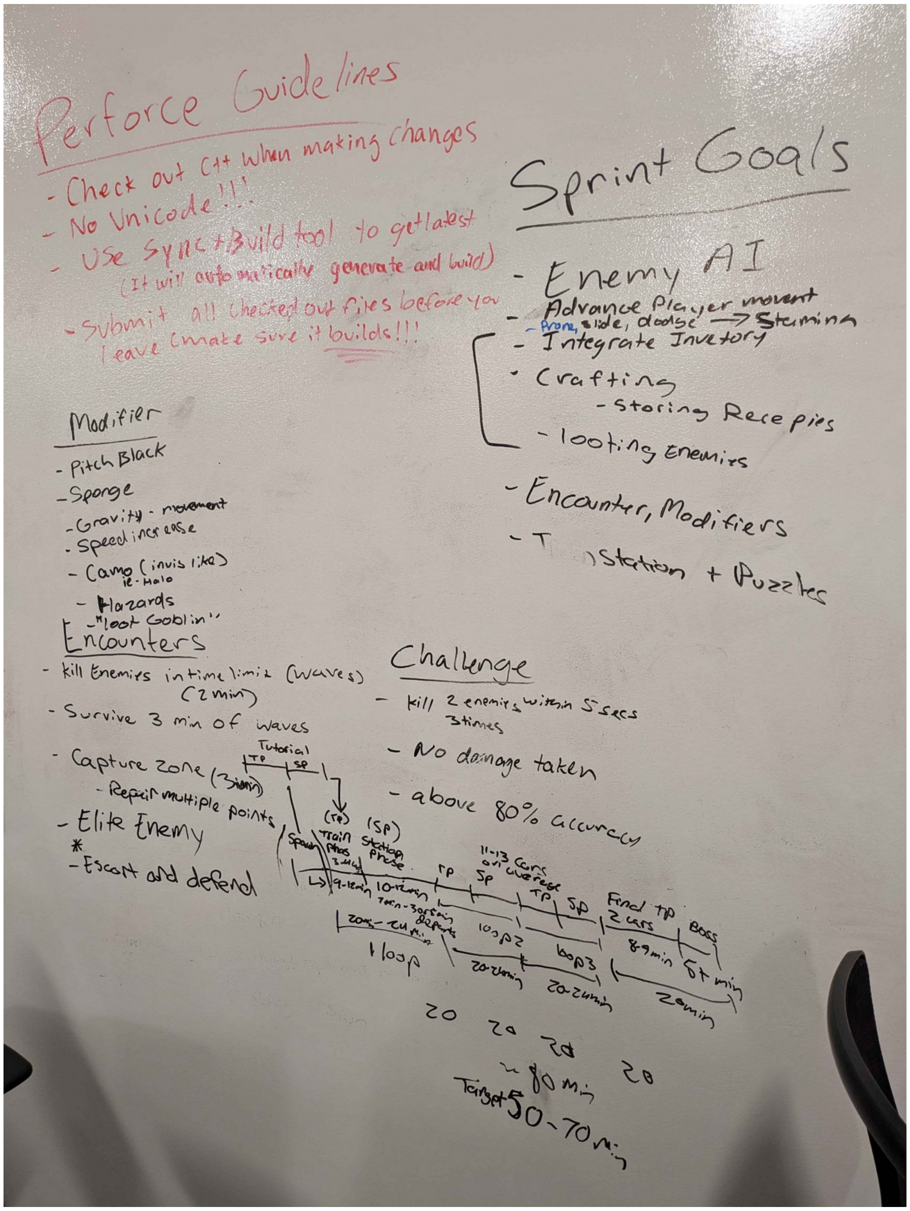
In this Final Sprint of the Semester, we want to wrap up all the core features of the game and get the final gameplay loop figured out. Since this is a Rogue-Like, we wanted to get a good idea of how long each run would take and how long a completion run would be. The goal is for the player to play a couple of times until they get enough progression to beat the final encounter, but all of the finalized times are to be determined based on playtest and content additions.
The main focus for me since the Train cars gameplay loop was finalized was to work with Yukon and finalize the design and gameplay loop for the first 2 train stations. We want a puzzle at each station, and the rest of the space to be explored and looted to craft useful tools to aid in combat in the Train cars. I have designed the first Puzzle room, where the player is to find and shoot three targets, which will then unlock a room/chest that will drop the Assault Rifle. The puzzle is relatively simple, as it will be part of the tutorial. I worked with Zexuan to help make the bullets for the gun be able to detect if the object being shot is a Target that it will destroy and increment a counter for the unlock condition.

Other Encounter Design-related things we discussed were additional Encounters, challenges and Modifiers that I will implement in the next sprint. These will help add variety to the levels so that they don't get repetitive with each run the player does. I have also talked with Serina about the finalized Traincar templates, so the amount of work is streamlined.





I need there to be one more meeting with the designers, producers, and engineers at the start of the next sprint to get the final vision of the game, now that we have a base to build off. This is from combat and enemies, to encounters, to any additional mechanics, and exploration, like finding lore to help build a story, and also have a final concrete vision for the environment design and how much time our environment artist will have.



Perforce Guidelines

- Check out C++ when making changes
- No Unicode!!!
- Use Sync+Build tool to getlatest
  (It will automatically generate and build)
- Submit all checked out files before you leave (make sure it builds!!!

Sprint Goals

- Enemy AI
- Advance Player movent
  - Prone, slide, dodge → Stamina
- Integrate Invetory
- Crafting
  - Storing Recepies
- looting Enemies
- Encounter, Modifiers
- T)Station + Puzzles

Modifier

- Pitch Black
- Sponge
- Gravity - movement
- Speed increase
- Camo (invis like)
  ie - Halo
- Hazards
- "loot Goblin"

Encounters

- kill Enemies in time limit (waves)
  (2 min)
- Survive 3 min of waves
- Capture zone (3 min)
  - Repair multiple points
- Elite Enemy
  *
- Escort and defend

Challenge

- kill 2 enemies within 5 secs
  3 times
- No damage taken
- above 80% accuracy

@Serina I have finalized the the train cars that we will need, to try to make the work as condensed as possible I have decided that we will have 4 different cars total two rooms of different lengths (train car 1 & 2) and then both will have a second floor design as well, so they are just taller with a second floor added on. I would like to aim for 3 variations (just assets placed differently/layout, so no new assets will be needed to be created). @Anson Feng This means we need to make it so enemies can path between floors and also the ability for them to jump up or over gaps

This will give us 12 different rooms based on 4 templates (really only 2 if you consider raising the ceiling to be easy)

I will design/white box the layouts and you can go in a place actually assets like we did for the car you are currently working on, and I can check it out to make sure everything flows
